

## WEEK 3

### AIM:

To implement Hamming code and CRC for Error Handling

### PROCEDURE:

#### PROGRAM-1: Hamming code

```
#include<stdio.h>
```

```
void client(int dataword[12])
```

```
{
```

```
    int c1,c2,c4,c8;//c1 c2 c4 c8 are check bits
```

```
    printf("\nVerifying Dataword");
```

```
    c1=dataword[0]^dataword[2]^dataword[4]^dataword[6]^dataword[8]^dataword[10];
```

```
    c2=dataword[1]^dataword[2]^dataword[5]^dataword[6]^dataword[9]^dataword[10];
```

```
    c4=dataword[3]^dataword[4]^dataword[5]^dataword[6]^dataword[11];
```

```
    c8=dataword[7]^dataword[8]^dataword[9]^dataword[10]^dataword[11];
```

```
    if(c1==0 && c2==0 && c4==0 && c8==0)
```

```

{
    printf("\nMessage not Corrupted");
}
else
{
    printf("\nMessage Corrupted");
}
}

void server(int *dataword)
{
    int p1,p2,p4,p8;//p1 p2 p4 p8 are parity bits

    p1=dataword[2]^dataword[4]^dataword[6]^dataword[8]^dataword[
10];

    dataword[0]=p1;

    p2=dataword[2]^dataword[5]^dataword[6]^dataword[9]^dataword[
10];

    dataword[1]=p2;

    p4=dataword[4]^dataword[5]^dataword[6]^dataword[11];

    dataword[3]=p4;

    p8=dataword[8]^dataword[9]^dataword[10]^dataword[11];

    dataword[7]=p8;

```

```

    for(int i=0;i<12;i++)
    {
        printf("%d->%d ",(i+1),dataword[i]);
    }

    client(dataword);
}

int main()
{
    int dataword[12],i;
    printf("Enter 8 bit Data word:\n");
    for(i=0;i<12;i++)
    {
        if(i==0 || i==1 || i==3 || i==7)
        {
            dataword[i]=0;
            continue;
        }

        scanf("%d",&dataword[i]); //input should be either 0 or 1
    }

    server(dataword);

    return 0; }

```
